

Abstract

5 A method and a data terminal for constructing a
data connection between an integrated household control
system (1) and a data terminal (11) located outside the
base of the integrated household control system. The
data terminal (11) is mobile and is controlled by a
position determining device (14) in such a way that if
the distance from the household control base drops to a
predetermined limit value, the construction of the data
10 connection with the integrated household control system
(1) is automatically initiated via a mobile interface
(18) of the data terminal.

Preferably, a computer in a motor vehicle (10)
serves as the mobile data terminal (11).
